

# ABSTRACT OF THE DISCLOSURE

An object of the present invention is to solve the difficulty of entering e-mail addresses. To enter an e-mail address, the e-mail address is formed by entering a partial e-mail address with an input section and selecting a desired partial e-mail address with a selection section from a plurality of partial e-mail addresses stored in a storage section while observing a display section. Consequently, it is not necessary to enter the entire e-mail address by hand with the input section, so that this troublesome task can be eliminated.
